CATALYTIC ACTIVITY: ATP + sulfate = diphosphate + adenylylsulfate.

CATALYTIC ACTIVITY: ATP + adenylylsulfate = ADP + 3' -

phosphoadenylylsulfate.

PATHWAY: FIRST AND SECOND STEPS IN THE SULFATE ACTIVATION PATHWAY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-0CT-1996 (Rel. 34, Created)

ALIGNMENTS

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The sequence was deduced from a cDNA clone (see AAZ94206) isolated from a foetal kidney library. It shows homology to human ATP sulfurylase/APS kinsse 2. TRNSFS-6 is expressed in cardiovascular, gastrointestinal, reproductive and endocrine tissues, especially those associated with cancer, inflammation and call proliferation. The new human transferases and polynucleotides can be used in the diagnosis, prevention and treatment of cancer, developmental disorders, gastrointestinal disorders, genetic cisculary disorders, and smooth muscale disorders. The reproductive disorders, and smooth muscale disorders. The polypeptides can also be used to raise antibodies, and to screen for agonists and antagonists of transferase activity.

         The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used the increase stem cell proliferation; to regulate hemantopoissis; and in

library (LUNGOOT 12). The DNRR-2 DNR sequence is useful for the production of the corresponding recombinant enzyme. The invention of the corresponding recombinant enzyme. The invention provides DNR enzymes, which are deoxyguanosine kinases, which catalyse the transfer of a terminal phosphate from adenosine triphosphate (ATP) or quanion triphosphate (GTP) to quanosine or quanidine in the requilation of cellular levels of GTP and its corresponding nucleoside triphosphate. As GTP levels are known to control the activity of certain oncogenic proteins e.g. p21ras, a protein involved in cell proliferation and concogenesis, suppression of the enzyme activity causes high ratios of GTP:GDP, promoting oncogenesis. Therefore, diseases (e.g. cancers, immune disorders and neurological dysfunction) related to this lack of activity may be prevented or treated with the recombinant enzyme, or by gene therapy based strategies. Anti-sense constructs of the DNKR encoding nucleic acids may also be used for inhibition of over-expression The present sequence represents a human disease related nucleotide kinase-2 (DRNK-2) protein sequence. The DNKR-2 encoding DNA sequence was first identified in Incyte Clone 373887 from the lung tissue CDNA þ Nucleic acids encoding de:oxy:guanosine kinase - useful for recombinant production of the enzyme for treating diseases caused lack of the enzyme e.g. cancers caused through loss of enzyme "adenosine 3'-phosphate 5'-phosphosulfate (PAPS)-dependent enzyme motif" Hillman JL; Length 624; p21ras; cell proliferation; oncogenesis; cancer; PAPS; immune disorder; neurological dysfunction; gene therapy; adenosine 3'-phosphate 5'-phosphosulfate-dependent enzyme ATP pyrophosphatase PP-motif.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC protein (e.g. AAX00602) for increasing the stability of the fused.

Protein as compared to the human protein only.

The invention relates to 87 novel genes and their fragments (nucleic acid sequences: AAX0611-X00724; amino acid sequences AAX0611-X00724; amino acid sequences AAX0611-X00724; amino acid sequences AAX06107-W68004) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 87 polynucleotides, based on which tissues they are most highly expressed in

                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CYSLDGDNVRHGLNRNLGFSPGDREENIRRIAEVAKLFADAGLVCITSFISPFAKDRENA 132
